Statistical Power Analysis is a nontechnical guide to power analysis in research planning that provides users of applied statistics with the tools they need for more effective analysis. The Second Edition includes: * a chapter covering power analysis in set correlation and multivariate methods; * a chapter considering effect size, psychometric reliability, and the efficacy of "qualifying" dependent variables and; * expanded power and sample size tables for multiple regression/correlation.

The U.S. Department of Defense's (DoD's) acquisition workforce (AWF) includes more than 169,000 personnel who are responsible for identifying, developing, buying, and managing goods and services to support the military. In 2018, Congress directed the Under Secretary of Defense for Acquisition and Sustainment to conduct an assessment of gaps in business acumen, knowledge of industry operations, and knowledge of industry motivation present within the AWF and to determine the effectiveness of training and development (T&D) resources offered by providers outside DoD that were available to AWF personnel. RAND was chosen to perform the assessment, and researchers used a mixed-methods approach to do so, including interviews with DoD and industry professionals and reviews of AWF competency models, Defense Acquisition University course

offerings, DoD policy, and academic and business literature. The authors found that the lack of standardized definitions obscures the need for knowledge related to business acumen, industry operations, and industry motivation, and while knowledge gaps appear to exist in these areas, the lack of requirements and desired proficiencies further hinders an estimation of the gaps' extent. DoD uses a wide array of internal and external T&D assets to develop the AWF, but training gaps related to these types of knowledge were difficult to determine in part because evidence about the effectiveness of different types of T&D is limited. The authors provide recommendations to DoD to improve how these types of knowledge are assessed and conferred as well as recommendations to Congress for incentivizing DoD's use of external T&D providers.

The book blends readability and accessibility common to undergraduate control systems texts with the mathematical rigor necessary to form a solid theoretical foundation. Appendices cover linear algebra and provide a Matlab overview and files. The reviewers pointed out that this is an ambitious project but one that will pay off because of the lack of good up-to-date textbooks in the area.

This book offers an updated article-by-article commentary of the Rome I Regulation, applicable in the courts of nearly all European countries to identify the law applicable to international contracts. The commentary is authored by an international group of academics and practitioners, who all have practical experience with international contracts and, thus, were able to focus on the needs of practice. This volume will be not only a reference guide for judges and practitioners alike, but also a crucial resource for academics and researchers.

The Restructured Extended Executor (REXX) language is a procedural language that allows you to write programs and algorithms in a clear and structural way. It is an interpreted and compiled language, and you do not have to compile a REXX command list before executing it. With IBM z/OS V1.9, you can harness the versatility of REXX to interface and interact with the power of SDSF. A new function called REXX with SDSF is available that provides access to SDSF functions through the use of the REXX programming language. This REXX support provides a simple and powerful alternative to using SDSF batch. This IBM Redbooks publication describes the new support and provides sample REXX execs that exploit the new function and that perform real-world tasks related to operations, systems

programming, system administration, and automation. This book complements the SDSF documentation, which is primarily reference information. The audience for this book includes operations support, system programmers, automation support, and anyone with a desire to access SDSF using a REXX interface.

The aim of this book volume is to explain the importance of Markov state models to molecular simulation, how they work, and how they can be applied to a range of problems. The Markov state model (MSM) approach aims to address two key challenges of molecular simulation: 1) How to reach long timescales using short simulations of detailed molecular models. 2) How to systematically gain insight from the resulting sea of data. MSMs do this by providing a compact representation of the vast conformational space available to biomolecules by decomposing it into states sets of rapidly interconverting conformations and the rates of transitioning between states. This kinetic definition allows one to easily vary the temporal and spatial resolution of an MSM from high-resolution models capable of quantitative agreement with (or prediction of) experiment to low-resolution models that facilitate understanding. Additionally, MSMs facilitate the calculation of quantities that are

difficult to obtain from more direct MD analyses, such as the ensemble of transition pathways. This book introduces the mathematical foundations of Markov models, how they can be used to analyze simulations and drive efficient simulations, and some of the insights these models have yielded in a variety of applications of molecular simulation.
