“ We are dropping cyber bombs. We have never done that before. ” —U.S. Defense Department official

A new era of war fighting is emerging for the U.S. military. Hi-tech weapons have given way to hi tech in a number of instances recently: A computer virus is unleashed that destroys centrifuges in Iran, slowing that country ' s attempt to build a nuclear weapon. ISIS, which has made the internet the backbone of its terror operations, finds its network-based command and control systems are overwhelmed in a cyber attack. A number of North Korean ballistic missiles fail on launch, reportedly because their systems were compromised by a cyber campaign. Offensive cyber operations like these have become important components of U.S. defense strategy and their role will grow larger. But just what offensive cyber weapons are and how they could be used remains clouded by secrecy. This new volume by

"Cyber war is coming," announced a landmark RAND report in 1993. In 2005, the U.S. Air Force boasted it would now fly, fight, and win in cyberspace, the "fifth domain" of warfare. This book takes stock, twenty years on: is cyber war really coming? Has war indeed entered the fifth domain? *Cyber War Will Not Take Place* cuts through the hype and takes a fresh look at cyber security. Thomas Rid argues that the focus on war and winning distracts from the

real challenge of cyberspace: non-violent confrontation that may rival or even replace violence in surprising ways. The threat consists of three different vectors: espionage, sabotage, and subversion. The author traces the most significant hacks and attacks, exploring the full spectrum of case studies from the shadowy world of computer espionage and weaponised code. With a mix of technical detail and rigorous political analysis, the book explores some key questions: What are cyber weapons? How have they changed the meaning of violence? How likely and how dangerous is crowd-sourced subversive activity? Why has there never been a lethal cyber attack against a country's critical infrastructure? How serious is the threat of "pure" cyber espionage, of exfiltrating data without infiltrating humans first? And who is most vulnerable: which countries, industries, individuals?

New technologies are changing how we protect our citizens and wage our wars. Among militaries, everything taken for granted about the ability to maneuver and fight is now undermined by vulnerability to “ weapons of mass disruption ” : cutting-edge computer worms, viruses, and invasive robot networks. At home, billions of household appliances and other “ smart ” items that form the Internet of Things risk being taken over, then added to the ranks of massive, malicious “ zombie ” armies. The age of Bitskrieg is here, bringing vexing threats that range from the business sector to the battlefield. In this new book, world-renowned cybersecurity expert John Arquilla looks unflinchingly at the challenges posed by cyberwarfare — which he argues have been neither met nor mastered.
