This volume presents the proceedings of the 12th IFIP/IEEE International Conference on Management of Multimedia and Mobile Networks and Services (MMNS 2009), which was held in Venice, Italy, during October 26–27 as part of the 5th International Week on Management of Networks and

Services(Manweek 2009). As in the previous four years, the Manweek umbrella allowed an international audience of researchers and scientists from industry and academia – who are researching and developing management systems – to share views and ideas and present their state-of-the-art results. The other events forming Manweek 2009 were the 20th IFIP/IEEE International Workshop on Distributed Systems: Operations and Management (DSOM 2009), the 9th IEEE Workshop on IP Operations and Management (IPOM 2009), the 4th IEEE International Workshop on Modeling Autonomic Communications Environments (MACE 2009), and the 6th International Workshop on Next Generation Networking Middleware (NGNM 2009). Under this umbrella, MMNS proved itself again as a major conference for research and

innovation in the management of multimedia technology and networked services. The scope of MMNS has been expanded in recent years to include management of emerging mobile and wireless networks and their integration with more traditional network infrastructures. The objective of the conference is to bring together researchers and scientists, from both academia and industry, interested in state-of-the-art management of converged multimedia networks and services across heterogeneous networking infrastructures, while creating a public venue for result dissemination and intellectual collaboration.

provides both professionals and students with an introduction to the problems and solutions of communicating multimedia traffic at high data rates over a radio channel for short distances. Wireless Multimedia Communications begins with an examination of the physical layer of the Open Systems Interface (OSI) stack, modeling the radio channel impairments, including path loss and multipath distortion. The book addresses infrared and satellite wireless channels and the digital modulation approaches used to convey information over these channels. It compares possible approaches to transmitting multimedia traffic, including equalization, multicarrier modulation, and spread spectrum. The book also presents an in-depth discussion of error control, with a look at the emerging and promising field of turbo coding. At the data

Multimedia services facilitate the real-time processing and communication of images, audio, and text. The convergence of computer communication and telecommunication has redefined current multimedia services, encouraging the creation of multimedia interfaces for videoconferencing, VoIP, instant messaging, and gaming. Multimedia Services and Streaming for Mobile Devices: Challenges and Innovations provides tutorials, surveys, case descriptions, and original contributions that address current research findings and

business success cases in multimedia services and streaming for mobile devices. This publication is useful to researchers, developers, engineers, and innovators working in multimedia services or mobile devices, as well as academics, industry professionals, and researchers who aspire to learn about recent progress and future trends in the field.

Wireless Multimedia Network Technologies addresses emerging concepts for developing third generation wireless systems, and covers both theoretically and technologically feasible improvements. Internationally recognized specialists have contributed original chapters on several core wireless technologies including intelligent and flexible radio access,
