Industrial Britain presents in three main sections a broad view of Britain during the Industrial Age. The first covers industrial change, the birth of the factory, the age of iron, patterns of trade, the slave trade, farming and transport, factory acts, wealth, and images of laborers. The second discusses societal change during the Industrial Age, population growth, changing cities, religion, migration, science and technology, and the role of women. The final section explores power roles: the power of the people, restoration of Parliament, and chartism. An engaging book that involves students in the study of history by raising thought-provoking questions and by providing activities to reinforce the topics studied.

The mid to late-19th century was a period of extraordinary expansion in British industry, leading to its emergence as the workshop of the world. The author uses a variety of pictorial and textual sources to examine the rapid increase in mechanization, the construction of the railways and advances in engineering and agriculture during this period, as well as the social effects of these changes on both rich and poor.

Is China becoming the "workshop of the world" in the same way as Britain and the United States once were; or is China - as some multinational companies believe - simply a processing segment in global production networks? This book examines China's role in the international division of labor: it analyzes the scale and scope of China's manufacture; the type and relative sophistication of its exports in the world market; and its position in the global value chain. It shows that China monopolizes industrial production by being the processing center of world. Based on extensive original research, this book examines the structure of production in global manufacturing industries, applying both qualitative and quantitative methods. It analyzes each segment of the value chain, exploring in depth several specific industrial sectors. It concludes that China has become deeply integrated into global manufacturing industry; that China's position in the value chain is still quite low, with relatively low research and development (R&D) and other similar high-value activities; but that, in some sectors, China is catching up rapidly, especially in newly emerging sectors.

Family and Business during the Industrial Revolution is about the small businesses that were at the heart of the economic growth and social transformation that characterized the industrial revolution in Britain. It challenges existing visions of the commercial landscape during this period, by examining some of the forgotten businesses of the industrial revolution, and the men and women who worked in them and ran them. Its approach, which spans economic, social, and cultural history, as well as encompassing business history and the histories of the emotions, space, and material culture, alongside studies of personal testimony, testatory practice, and property ownership, tests current understandings of gender, work, family, class, and power in the late eighteenth and early nineteenth centuries. It provides us with new insights into the lives of ordinary men and women in trade, whose humble lives are easily overlooked, but who were central to the story of a pivotal period in British history.

Why did the industrial revolution take place in eighteenth-century Britain and not elsewhere in Europe or Asia? In this convincing new account Robert Allen argues that the British industrial revolution was a successful response to the global economy of the seventeenth and eighteenth centuries. He shows that in Britain wages were high and capital and energy cheap in comparison to other countries in Europe and Asia. As a result, the breakthrough technologies of the industrial revolution - the steam engine, the cotton mill, and the substitution of coal for wood in metal production - were uniquely profitable to invent and use in Britain. The high wage economy of pre-industrial Britain also fostered industrial development since more people could afford schooling and apprenticeships. It was only when British engineers made these new technologies more cost-effective during the nineteenth century that the industrial revolution would spread around the world.

Europe is the cradle of the modern international chemical industry. From the middle of the nineteenth century until the outbreak of World War I, the European chemical industry influenced not only the production and control of science and technology, but also made significant contributions towards economic development, as well as bringing about profound changes in working and living environments. It is a highly complex heritage, both rich and threatening, that calls for close scrutiny. Fortunately, a unique opportunity to explore the historical development of the European chemical industry from a variety of novel standpoints, was made possible during 1993 as part of the European Science Foundation (ESF) programme called 'The Evolution of Chemistry in Europe, 1789-1939.' This process of exploration has taken place through three workshops, each dealing with different time periods. The workshop concerned with the period 1850-1914, which corresponds roughly to the so-called Second Industrial Revolution, was held in Maastricht, The Netherlands, on 23-25 March 1995. This volume is the outcome of that workshop. The other workshops dealing with European chemical industry were held in Liege in 1994, covering the First Industrial Revolution period, 1789-1850, and Strasbourg in 1996, covering the period between the two World Wars.
