The purpose of this manual is to provide recovery system engineers in government and industry with tools to evaluate, analyze, select, and design parachute recovery systems. These systems range from simple, one-parachute assemblies to multiple-parachute systems, and may include equipment for impact attenuation, flotation, location, retrieval, and disposition. All system aspects are discussed, including the

need for parachute recovery, the selection of the most suitable recovery system concept, concept analysis, parachute performance, force and stress analysis, material selection, parachute assembly and component design, and manufacturing. Experienced recovery system engineers will find this publication useful as a technical reference book; recent college graduates will find it useful as a textbook for learning about parachutes and parachute recovery systems; and technicians with extensive practical experience will find it useful as an engineering

textbook that includes a chapter on parachute-related aerodynamics. In this manual, emphasis is placed on aiding government employees in evaluating and supervising the design and application of parachute systems. The parachute recovery system uses aerodynamic drag to decelerate people and equipment moving in air from a higher velocity to a lower velocity and to a safe landing. This lower velocity is known as rate of descent, landing velocity, or impact velocity, and is determined by the following requirements: (1) landing personnel uninjured and

ready for action, (2) landing equipment and air vehicles undamaged and ready for use or refurbishment, and (3) impacting ordnance at a preselected angle and velocity.

July 2019 Printed in BLACK AND WHITE The Army's Weapon Systems Handbook was updated in July 2019, but is still titled "Weapon Systems Handbook 2018." We are printing this in black and white to keep the price low. It presents many of the acquisition programs currently fielded or in development. The U.S. Army Acquisition Corps, with its 36,000 professionals, bears

a unique responsibility for the oversight and systems management of the Army's acquisition lifecycle. With responsibility for hundreds of acquisition programs, civilian and military professionals collectively oversee research, development and acquisition activities totaling more than \$20 billion in Fiscal Year 2016 alone. Why buy a book you can download for free? We print this so you don't have to. We at 4th Watch Publishing are former government employees, so we know how government employees actually use the standards. When a new standard is released,

Somebody has to print it, punch holes and put it in a 3-ring binder. While this is not a big deal for a 5 or 10-page document, many DoD documents are over 400 pages and printing a large document is a time-consuming effort. So, a person that's paid \$25 an hour is spending hours simply printing out the tools needed to do the job. That's time that could be better spent doing mission. We publish these documents so you can focus on what you are there for. It's much more cost-effective to just order the latest version from Amazon.com. SDVOSB If there is a standard you

The Department of Defense
(DOD) is in the process of a

modernization of its
approach to commanding

military forces. Senior DOD leaders have stated that the department's existing command and control architecture is insufficient to meet the demands of the 2018 National Defense Strategy (NDS). Joint All-Domain Command and Control (JADC2) is DOD's concept to connect sensors from all of the military services-Air Force, Army, Marine Corps, Navy, and Space Force-into a single network. DOD points to ride-sharing service Uber as an analogy to describe its desired end state for JADC2. Uber combines two different apps-one for riders and a second for drivers. Using the

Commander users' positions, the Uber algorithm determines the optimal match based on distance, travel time, and passengers (among other variables). In the case of JADC2, that logic would find the optimal platform to attack a given target, or the unit best able to address an emerging threat. For JADC2 to work effectively, DOD is pursuing two emerging technologies: automation and artificial intelligence, and new communications methods. Several agencies and organizations within DOD are involved in JADC2-related efforts.

NATO Glossary of terms and definitions (English and French). Listing terms of military significance and their definitions for use in NATO.

This report discusses the information needs of commanders of higher-echelon Army units. The authors identified three different modes of command-post-level communication--pipeline, alarm, and tree. Each mode is indicative of a different communication relationship between a commander and his staff, and each places a different demand on the command-and-control operating system. To fulfill

Commanders' information needs, the authors recommend a number of education and training measures: institutionalize back briefing, teach process as well as procedures, and train unit command staffs to share images. As for the design of information systems, they recommend that the Army identify means of more direct image sharing, build a hybrid information system, and establish an end-user to end-user communications orientation.

engineering. The contents in this book are presented at a theoretical-practical level. It explains vehicle dynamics concepts in detail, concentrating on their practical use. Related theorems and formal proofs are provided, as are real-life applications. Students, researchers and practicing engineers alike will appreciate the user-friendly presentation of a wealth of topics, most notably steering, handling, ride, and related components.
