Introduction In Haskell, pattern matching is mostly nice and easy. It might be made more complicated by strictness annotations (i.e. whether to evaluate sub-patterns lazily or strictly) or irrefutability annotations, but it doesn't have any special interactions with ownership, borrowing and mutability which are bread and butter of Rust.

In the last decade, research on the previously dormant field of camouflage has advanced rapidly, with numerous studies challenging traditional concepts, investigating previously untested theories and incorporating a greater appreciation of the visual and cognitive systems of the observer. Using studies of both real animals and artificial systems, this book synthesises the current state of play in camouflage research and understanding. It introduces the

different types of camouflage and how they work, including background matching, disruptive coloration and obliterative shading. It also demonstrates the methodologies used to study them and discusses how camouflage relates to other subjects, particularly with regard to what it can tell us about visual perception. The mixture of primary research and reviews shows students and researchers where the field currently stands and where exciting and important problems remain to be solved, illustrating how the study of camouflage is likely to progress in the future.

energy physics. Although the particle spectrum of the Standard Model is now complete with the Higgs boson, the hierarchy problem and the lack of explanation of the origin of dark matter imply that a new Beyond the Standard Model physics should exist. There is however no clear indication (experimental or otherwise) of the energy scale at which this new physics should appear. Current results from the LHC experiments have shown no unpredicted effects up to pp collision energies of 13 TeV. If not observed directly at the LHC, the new physics may reveal itself through deviations of Higgs properties from their Standard Model expectations, or it may become directly accessible only at new, higher-energy

accelerator facilities. It is then of primary importance to have a comprehensive review of the available and planned accelerators and their design, physics motivation and expected performance. This book comprises 26 carefully edited articles with well-referenced and up-to-date material written by many of the leading experts. These articles — originated from presentations and dialogues at the second HKUST Institute for Advanced Study Program on High Energy Physics — are organized into three aspects, Theory, Accelerator, and Experiment, focusing on in-depth analyses and technical aspects that are essential for the developments and expectations for the future high energy physics.

This book is a comprehensive reference for men who are looking for more power and choice in their dating life with women. When you Become That Guy who is both sexy and exciting while also being the kind of man who a woman would want for a longer term relationship or marriage, you will have options and choice in your relationships with women. The book addresses fundamental skills and understandings

designed to help a man have power and choice in his relationships with women. Positive and realistic beliefs about yourself, women, relationships and sexuality are covered that provide an essential foundation for developing the identity as a man who is powerfully attractive to women. The book is filled with drills and exercises so that you can take action to develop yourself. Instead of being a guy who says things in order to get something, you become that guy who gets what he wants in his relationships with women as an authentic expression of who you are.

String algorithms are a traditional area of study in computer science. In recent years their importance has grown dramatically with the huge increase of electronically stored text and of molecular sequence

data (DNA or protein sequences) produced by various genome projects. This 1997 book is a general text on computer algorithms for string processing. In addition to pure computer science, the book contains extensive discussions on biological problems that are cast as string problems, and on methods developed to solve them. It emphasises the fundamental ideas and techniques central to today's applications. New approaches to this complex material simplify methods that up to now have been for the specialist alone. With over 400 exercises to reinforce the material and develop additional topics, the book is suitable as a text for graduate or advanced undergraduate students in computer science, computational biology,

This book is a contribution to the ongoing debate in agrammatism, an acquired language disorder resulting from left hemisphere brain damage. The aim of the book is (1) to give a comprehensive account of agrammatism and outlines and critically examines the different accounts of agrammatic production and asyntactic comprehension, (2) to address morphological and structural properties of Moroccan

Arabic agrammatic speech and (3) to put under scrutiny Friedmann and Grodzinsky's (1997) syntactic account of tense and agreement in production and across modalities. The book attempts to answer two important research questions: Are tense and agreement dissociated as predicted by the Tree-Pruning Hypothesis (Friedmann and Grodzinsky, 1997)? Is the tense/agreement dissociation "production-specific", or does it extend to comprehension and grammaticality judgment? A third objective of the book is to examine the comprehension abilities of four Moroccan Arabic-speaking agrammatic subjects in the light of the Trace Deletion Hypothesis (Grodzinsky, 1995 a, b). A major

research question is whether or not active sentences and subject relative sentences are understood better than object relative sentences. The book takes the view the tense/agreement dissociation reported for Hebrew (Friedmann and Grodzinsky, 1997) and German (Wenzlaff and Clahsen, 2003) can be replicated in Moroccan Arabic. However, the syntactic account as outlined in Friedmann and Grodzinsky (1997) cannot account for the tense/agreement dissociation as Moroccan Arabic has the agreement node above the tense node. In addition, the Trace Deletion Hypothesis cannot account for the comprehension difficulties experienced by the four Moroccan Arabic-speaking agrammatic subjects; the

case is so because both subject relatives and object relatives are understood below chance level. Based on data collected through different experimental methods, it is argued that the deficit in agrammatism cannot be explained in terms of a structural account, but rather in terms of a processing account. Access to syntactic knowledge tends to be blocked; grammatical knowledge, however, is entirely intact.
