Today, networking capability in one form or another- in particular internet accessibility- is becoming mandatory in many embedded applications, including home appliances, security, automotive design, and industrial control. Sophisticated networking and communications capabilities that were previously the sole domain of mainframes, PC's and workstations are now moving into the realm of smaller embedded microprocessors and microcontrollers. However, the documentation for standards for implementing networking functionality using small microcontrollers are not in place, and design information is difficult to find. This book pulls together the necessary design information and shows how to use today's affordable microcontrollers for powerful network applications such as LAN's (local area networks) and embedded

internet. Using working code examples and schematic diagrams, the reader is guided through the basics of developing his or her own applications using two popular microcontrollers, the Atmel AVR and PIC. The features and pros/cons of the two microcontroller families are compared and contrasted throughout. Full working designs for implementing embedded internet and Ethernet connectivity are described and sample source code is provided and thoroughly explained. Also, since storage is an issue, particularly with embedded internet, the book describes how to interface the microcontrollers to a standard ATA hard drive such as those found in personal desktop, laptop and server-class computers. The book will also cover wireless connections, providing the information necessary to effect a wireless link between two Atmel-based, and two PIC-based devices. An accompanying CDROM contains the
