This updated and expanded edition of the book includes four additional chapters on earthwork on sloping sites; transitional curves and super elevation; calculations of super elevations on composite curves; and underground mine surveying. Richly illustrated with diagrams, equations and tables as well as examples of every day survey tasks. It also covers new topics, such as the global navigation satellite system ' s (Real Time Kinematic-RTK), which are increasingly used in a wide range of everyday engineering applications.

Climate change has arrived, and it's not going away. In the absence of effective world action, global warming is certain to continue. The Handbook is not another book about climate change science or politics. Rather it is an intelligent guide, and a potential ground breaker, for all of us who feel helpless in the face of government disagreement, and want to know in a practical way what we can do now. Not only will The Handbook help you prepare for

increased droughts, floods, fires and heatwaves, it will provide you with stories and advice from individuals who are already quietly doing amazing things. Jane Rawson and James Whitmore, previously Environment editors for The Conversation, look at how to establish your risk and face your fears; where to live and with whom; and how to survive heat, fire and flood. They investigate ways to provide your own food, power and water, make sure you can still get around, and get rid of your waste and sewage. They talk about new ways to think about home and possessions, the sadness of living through climate change, and how, for both individual and common good, we might positively change the way we live. The Handbook is both practical and philosophical. It can be read cover-to-cover, or dipped into when you need specific advice. It can help you plan and execute a strategy to deal with the effects of climate change. It might change your life. But it should also make you ask, does it really have to be this way?

Sydney: a beautiful international city with impressive buildings, harbour-side walkways, public gardens, cafes, restaurants, theatres and hotels. This is the way Sydney is represented to its citizens and to the rest of the world. But there has always been another Sydney not viewed so fondly by the city's rulers, a radical part of Sydney. The working-class suburbs to the south and west of the city were large and explosive places of marginalised ideas, bohemian neighbourhoods, dissident politics and contentious action. Through a series of snapshots, Radical Sydney traces its development from The Rocks in the 1830s to the inner suburbs of the 1980s. It includes a range of incidents, people and places, from freeing protestors in the anti-conscription movement, resident action movements in Kings Cross, anarchists in Glebe, to Gay Rights marches on Oxford Street and Black Power in Redfern.

The Handbook of Natural Language Processing, Second Edition presents practical tools and techniques for implementing natural language processing in computer systems. Along with removing outdated material, this edition updates every chapter and expands the content to include emerging areas, such as sentiment analysis. New to the Second Edition Greater

This book teaches readers ground engineering principles and related mining and risk management practices associated with underground coal mining. It establishes the basic elements of risk management and the fundamental principles of ground behaviour and then applies these to the essential building blocks of any underground coal mining system, comprising excavations, pillars, and interactions between workings. Readers will also learn about types of ground support and reinforcement systems and their operating mechanisms. These elements provide the platform whereby the principles can be applied to mining practice and risk management, directed primarily to bord and pillar mining, pillar extraction, longwall mining, sub-surface and surface subsidence, and operational hazards. The text concludes by presenting the framework of risk-based ground control management systems for achieving safe workplaces and efficient mining operations. In addition, a comprehensive reference list provides additional sources of information on the subject. Throughout, a large variety of examples show good and bad mining situations in order to demonstrate the

application, or absence, of the established principles in practice. Written by an expert in underground coal mining and risk management, this book will help students and practitioners gain a deep understanding of the basic principles behind designing and conducting mining operations that are safe, efficient, and economically viable. Provides a comprehensive coverage of ground engineering principles within a risk management framework Features a large variety of examples that show good and poor mining situations in order to demonstrate the application of the established principles in practice Ideal for students and practitioners About the author Emeritus Professor Jim Galvin has a relatively unique combination of industrial, research and academic experience in the mining industry that spans specialist research and applied knowledge in ground engineering, mine management and risk management. His career encompasses directing ground engineering research groups in South Africa and Australia; practical mining experience, including active participation in the mines rescue service and responsibility for the design, operation, and management of large underground coal mines and for the consequences of loss of ground control as a mine manager; appointments as Professor and Head of the School of Mining Engineering at the University of New South Wales; and safety advisor to a number of Boards of Directors of organisations associated with mining. Awards Winner of the ACARP Excellence Research Award 2016. The Australian Coal Industry's Research Program selects recipients to receive ACARP Research and Industry Excellence Awards every two years. The recipients are selected on the recommendation of technical committees. They are honored for achievement of a considerable advance in an area of importance to the Australian coal mining industry. An important criterion is the likelihood of the results from the project being applied in mines. Winner of the Merv Harris Award from the Mine Managers Association of Australia. The Merv Harris Award is named for Merv Harris who donated money to be invested for a continuing award in 1988. With the award, the Mine Managers Association of Australia honors members of the Association who demonstrate technical achievement in the Australian Coal Mining Industry. The first award was granted in 1990, since then, only two people have received this honor. The book has received the following awards.... AGS (Australian Geomechanics Society) congratulates Dr Galvin for these awards

The rapidly growing field of computational social choice, at the intersection of computer science and economics, deals with the computational aspects of collective decision making. This handbook, written by thirty-six prominent members of the computational social choice community, covers the field comprehensively. Chapters devoted to each of the field's major themes offer detailed introductions. Topics include voting theory (such as the computational complexity of winner determination and manipulation in elections), fair allocation (such as algorithms for dividing divisible and indivisible goods), coalition formation (such as matching and hedonic games), and many more. Graduate students, researchers, and professionals in computer science, economics, mathematics, political science, and philosophy will benefit from this accessible and self-contained book.
